Overview

This report provides a detailed assessment of the deployment scripts and the resulting on-chain deployments of the USDT and xAUT tokens across multiple blockchain networks.

USDT0 and XAUt0 are ERC-20 wrappers for Tether (USDT) and Tether Gold (XAUt), designed to integrate with LayerZero's Omnichain Fungible Token (OFT) standard. By leveraging this protocol, the tokens gain native cross-chain functionality, enabling seamless transfers, storage, and usage across multiple blockchain networks without relying on third-party bridges.

This approach ensures consistent liquidity and usability under the Omnichain liquidity standard powered by LayerZero. To realize this vision, Everdawn is deploying USDT0 and XAUt0 across various chains, ensuring interoperability and accessibility wherever the tokens are used.

The table below shows all the tokens on which the two tokens are deployed ("✓" indicates that the token is deployed on this network).

Network	USDT0	XAUt0
Corn	✓	
HyperLiquid	✓	
Unichain	✓	
Arbitrum		✓
Avalanche		✓
Polygon		✓
HyperEVM		✓
Optimism	✓	
Rootstock	✓	
X Layer	✓	
Ink		✓

Network	USDT0	XAUt0
Plasma	✓	✓
Celo		✓
Solana		✓

Approach

The deployment of the USDT0 and XAUt0 tokens depends on two main contracts:

- The **OFT contract** ([0Upgradeable](#)), responsible for minting and burning tokens in cross-chain operations. This contract is maintained in the [usdt0-oft-contracts](#) repository.
- The **token contract**, which represents the wrapped token itself. This contract is maintained in the [usdt0-tether-contracts-hardhat](#) repository.

Both the OFT and token contracts are deployed behind upgradeable proxies, with administrative control managed by a ProxyAdmin contract.

For each deployment assessment, the following items are verified:

1. The on-chain bytecode of the proxy, implementation, and admin contracts for both the OFT and token contracts matches the expected bytecode.
2. Proxies are correctly pointing to their intended implementation addresses.
3. ProxyAdmin contracts are properly configured and associated with the respective proxies.
4. The OFT contract is linked to the correct token address and the appropriate LayerZero endpoint configuration for the given chain.
5. Where applicable, scheduled transactions in the Safe related to the setup and configuration of these contracts are reviewed upon request.

More specific information, including chain-by-chain details and links to the relevant pull requests, can be found in the sections below.

USDT0

This section presents an assessment of the deployment scripts and on-chain deployments of the USDT0 token across various blockchain networks.

Corn Network

Deployment scripts for the Corn network were reviewed at [pull request #68](#) of the [Everdawn-Labs/usdt0-oft-contracts](#) repository and [pull request #48](#) of the [Everdawn-Labs/usdt0-tether-contracts-hardhat](#) repository.

Regarding the scripts in [Everdawn-Labs/usdt0-oft-contracts](#) repository:

- The Corn chain configuration as a LayerZero endpoint has been added properly ([hardhat.config.ts](#)).
 - Endpoint is added using the LayerZero's [lz-definitions](#) module.
 - *Safe API for the corn chain has been specified. However, the Safe account address is missing at the moment even though [it has been created](#).*
- The Corn deployment configuration for the [0Upgradeable](#) contract has been added properly ([deploy/Productiondeployments.ts](#)):
 - The USDT0 token address in the Corn mainnet chain, which will be an initialization argument for [0Upgradeable](#), is correct ([deploy/Productiondeployments.ts](#)).
- The Corn [0Upgradeable](#) contract has been added as an extra supported endpoint to the LayerZero configuration script. Connections with the rest of the currently supported endpoints have been set as well ([layerzero-prod.config.ts](#)).

Regarding the scripts in [Everdawn-Labs/usdt0-tether-contracts-hardhat](#) repository:

- The Corn chain configuration has been added properly ([hardhat.config.js](#)):
 - [chainId](#) is set correctly.

HyperLiquid Network

Deployment scripts for the Hyperliquid network were reviewed at [pull request #92](#) ([commit b8d9176](#)) of the [Everdawn-Labs/usdt0-ofc-contracts](#) repository and [pull request #60](#) ([commit e4bdcc6](#)).

Unichain and Optimism Mainnet Networks

Deployment scripts for both Unichain and Optimism mainnet deployments, as well as the upgrade of the [TetherToken0FTEExtension](#) and [0Upgradeable](#) contracts which is relevant to ERC-7802, were reviewed at [pull request #51](#) and commit [75e33fd](#), and at [pull request #73](#) and commit [fa02ae3](#).

A bytecode-level comparison between the compiled versions of the audited code and the deployed contracts found no discrepancies. Additionally, the following Safes and transaction ranges were reviewed:

- Unichain Safe at [0x4DFF9b5b0143E642a3F63a5bcf2d1C328e600bf8](#), covering transactions 5 through 28
- Optimism Safe at [0x4DFF9b5b0143E642a3F63a5bcf2d1C328e600bf8](#), covering transactions 2 through 25

Rootstock Network

A bytecode-level comparison was performed for the Rootstock token deployment included in [pull request #68](#) at [commit 2e33f36](#). The same verification was done for the deployment of the [0Upgradeable](#) contract on the Rootstock network in [pull request #101](#) at [commit 74cb488](#). The verifications were performed on 23 June, 2025 and found no discrepancies.

Additionally, the following Safe and transaction ranges were reviewed:

- Rootstock Safe at [0x425d1D17C33bdc0615eA18D1b18CCA7e14bEeb58](#), covering transactions 0 through 1

X Layer Network

A bytecode-level comparison was performed for the X Layer token deployment included in [pull request #71](#) at [commit 7c2c807](#). The same verification was done for the deployment of the

`0Upgradeable` contract on the X Layer network in [pull request #111](#) at [commit fe12ab6](#). The verifications were performed on 3 Sep, 2025 and found no discrepancies.

Plasma Network

A bytecode-level comparison was performed for the Plasma token deployment included in [pull request #75](#) at [commit 568c718](#). The same verification was done for the deployment of the `0Upgradeable` contract on the Plasma network in [pull request #115](#) at [commit e777fb4](#). The verifications were performed on 12 Sep, 2025 and found no discrepancies.

XAUt0

This section presents an assessment of the deployment scripts and on-chain deployments of the XAUt0 token across various blockchain networks.

Arbitrum, Avalanche, Polygon, and HyperEVM

After concluding the deployment assessment of USDT0, the audit team performed a deployment assessment of XAUt0 (Tether Gold) on Arbitrum, Avalanche, Polygon, HyperEVM. This includes both the token itself (i.e., [TetherToken0FTExtension](#) on Arbitrum, Avalanche, and Polygon, and [HyperliquidExtension](#) on HyperEVM) as well as the [0Upgradeable](#) contracts intended to integrate with LayerZero to support cross-chain minting and burning. A bytecode-level comparison between the compiled versions of the contracts in the repository and the deployed versions on-chain revealed no discrepancies.

The token deployment changes are included in [pull request #57](#) at [commit d759fcf](#) and [commit 5d91fb0](#). The [0Upgradeable](#) deployment changes are included in [pull request #90](#) at [commit b2c53dc](#) and [commit 3f80661](#). Specifically for Avalanche, a new implementation of the [0Upgradeable](#) contract has been deployed in [pull request #96](#) at [commit 4edbf26](#).

Ink Network

A bytecode-level comparison was performed for the Ink token deployment included in [pull request #79](#) at [commit e69f0fb](#). The same verification was done for the deployment of the [0Upgradeable](#) contract on the Ink network in [pull request #115](#) at [commit 55504fd](#). The verifications were performed on 12 Sep, 2025 and found no discrepancies.

Plasma Network

A bytecode-level comparison was performed for the Plasma token deployment included in [pull request #75](#) at [commit 50ae619](#). The same verification was done for the deployment of the [0Upgradeable](#) contract on the Plasma network in [pull request #115](#) at [commit 090be7c](#). The verifications were performed on 12 Sep, 2025 and found no discrepancies.

Celo Network

A bytecode-level comparison was performed for the Celo token deployment included in [pull request #80](#) at [commit ce7c583](#). The same verification was done for the deployment of the [0Upgradeable](#) contract on the Celo network in [pull request #127](#) at [commit a55fe19](#). The verifications were performed on 15 Sep, 2025 and found no discrepancies.

Solana Network

A deployment verification was performed for the XAUt0 token on Solana at program address [9zWqf5jhauvXMc9RETXD9xbAMBrJpzLpU9P](#). LayerZero OFT infrastructure is correctly deployed and operational. Bytecode comparison could not be performed due to program keypair differences, but deployment integrity was confirmed. The verifications were performed on 15 Sep, 2025 and found no discrepancies.

Scheduled Transactions Review

In addition, the scheduled transactions in the Safe wallets of each supported chain were reviewed. For reference, the Safe wallet addresses for each one of the supported chains are listed below.

Chain	Safe Wallet Address	TXs Reviewed
Ethereum	0x4DFF9b5b0143E642a3F63a5bcf2d1C328e600bf8	31-39
Arbitrum	0x4DFF9b5b0143E642a3F63a5bcf2d1C328e600bf8	34-42
Ink	0xc95de55ce5e93f788A1Faab2A9c9503F51a5dAE2	29-38
Flare	0x6ae078461f35c3cC216A71029F71ee7Bc4d9a10b	23-31
Berachain	0x425d1D17C33bdc0615eA18D1b18CCA7e14bEeb58	35-43

Conclusion

OpenZeppelin reviewed the scripts that deploy the UST0 and XAUt0 tokens across various blockchain networks. Overall, everything appears to be in order. The audit team is grateful to Everdawn as a partner and looks forward to their project's success.
